

How do organizational changes and seasonal trends affect employee attrition?

Interpretation:

The graph shows important trends in employee attrition related to changes in the organization and seasonal shifts. In April, there's a noticeable increase, likely due to some changes in how things work. During Summer, more people tend to leave, which we can see in the rising trend on the graph.

Remarkably, attrition goes down in November and December, probably because of the holidays when people are less likely to leave their jobs. In essence, the graph makes it easy to quickly grasp and interpret the nuanced patterns in employee attrition, allowing for more informed decision-making based on visual data representation.
