

Interpretation:- The scatter plot reveals suspected outliers in 2002, 2016, 2017, and 2020, showing substantial deviations from the usual pattern. The box plot confirms these suspected outliers as actual outliers by using 1.5 IQR method. These particular years are also highlighted on the line graph, indicating significant fluctuations in the data during those periods. Therefore, all the different plots agree about these unusual years which help us understand how they stand out from the rest.
